

CFD - Lecture 1

- Differential Equations involve derivatives with respect to various coordinates in space-time (x, y, z, t)
- The first concept is that in order to solve the differential equation numerically, we will have to make the solution $(u(x, y, z, t))$, and all of the derivatives of the solution w.r.t. all of the variables:

$$\left(\frac{\partial u}{\partial x}, \frac{\partial^2 u}{\partial t^2}, \frac{\partial^4 u}{\partial z^4}, \dots \right)$$

DISCRETE

... imagine a

→ To do this, we use a grid in space-time. For simplicity we will imagine first a grid in (x, t) .

- grid lines of the same coordinate never intersect
- grid lines of different coordinates intersect only once.
- grid spacing is not necessarily even.

→ grid lines are not necessarily straight
(e.g. polar, cylindrical
spherical)

Taylor series approximation of a
function:

$$f(x) \approx f(x_0) + (x-x_0) \frac{\partial f}{\partial x} + \frac{(x-x_0)^2}{2!} \frac{\partial^2 f}{\partial x^2} + \dots + \frac{(x-x_0)^n}{n!} \frac{\partial^n f}{\partial x^n}$$

$$\Downarrow$$
$$\frac{\partial f}{\partial x} = \frac{f(x) - f(x_0)}{x - x_0} - \frac{x_0 - x_0}{2!} \frac{\partial^2 f}{\partial x^2} - \frac{(x-x_0)^2}{3!} \frac{\partial^3 f}{\partial x^3} - \dots - \frac{(x-x_0)^{n-1}}{n!} \frac{\partial^n f}{\partial x^n}$$

If $x - x_0 \equiv \Delta x$ is small, then
higher order terms are small, and

higher order terms
can be neglected.

DISCRETE FIRST DERIVATIVE SCHEMES :

① Forward Difference.

$$\frac{\partial f}{\partial x} \approx \frac{f(x_0 + \Delta x) - f(x_0)}{\Delta x} + O(\Delta x)$$

$$\boxed{\frac{\partial f}{\partial x} = \frac{f_{i+1} - f_i}{\Delta x} + O(\Delta x)}$$

truncation error

② Backward Difference.

$$\frac{\partial f}{\partial x} = \frac{f_i - f_{i-1}}{\Delta x} + O(\Delta x)$$

③ Central Difference.

$$\frac{\partial f}{\partial x} = \frac{f_{i+1} - f_{i-1}}{\Delta x} + O(\Delta x^2)$$

Δx

$2\Delta x$

Crucial Point: Which scheme works best depends upon the differential Equation being considered.
